Competency-Based Technical and Vocational Teaching

LET · technical-vocational-teacher-education · BoardPrep lesson v1

Official examination scope

Original review of competency-based outcomes, demonstration assessment, workshop safety, feedback, and industry-informed learning. Scope is limited to the linked official board outline and curriculum references; this is not an exam prediction.

Learning objectives

- Translate a competency into observable performance criteria.
- Plan a safe demonstration and practice sequence.
- Give evidence-based feedback and document reassessment fairly.

1. Competency and performance evidence

A competency describes the integrated knowledge, skill, and judgment required for a work task. Turn it into observable criteria: the product or service standard, process steps, safety behaviors, and conditions. Criteria should distinguish essential performance from cosmetic preference. A learner may know a procedure verbally but still need a practical demonstration; use evidence that matches the stated competency and equipment context.

- State the task, conditions, and standard.
- Choose evidence aligned to the performance claim.
- Separate safety-critical criteria from refinements.

2. Demonstrate, practice, coach

A strong sequence makes expert thinking visible, then gives learners supported practice before independent performance. Demonstration should name decision points, setup checks, and common faults. Practice needs a defined task, sufficient equipment, observation, and corrective feedback. Feedback is most useful when it points to a criterion and an actionable next attempt rather than giving a global judgment about ability.

- Model setup and decision checks aloud.
- Use a short practice task before the full performance.
- Give feedback tied to one or two criteria.

3. Safety is part of competence

Safety is not an optional add-on to technical quality. Identify hazards, required controls, protective equipment, emergency steps, and stop-work conditions before practice. A paper assessment cannot substitute for a safe workshop routine. When equipment, materials, or supervision are insufficient, defer the hazardous task or use an approved alternative rather than asking learners to improvise.

- Inspect the work area and equipment before use.
- State the control and stop condition for each significant hazard.
- Record and correct near misses through the proper process.

4. Assessment, remediation, and workplace links

Use criterion-based assessment with clear evidence, consistent conditions, and a documented result. If a learner is not yet competent, identify the unmet criterion, plan targeted practice, and reassess under suitable conditions. Workplace examples should reflect current tools and actual standards, but a local employer preference should not be presented as a universal competency without evidence.

- Report which criterion is and is not demonstrated.
- Plan practice against the gap and allow fair reassessment.
- Keep industry examples tied to recognized learning outcomes.

Diagnose the performance gap

Question: A learner’s assembly works, but a guard is missing and the final measurement exceeds the stated tolerance. How should feedback and reassessment be planned?
1. Treat the missing guard as a safety-critical failure and stop use of the assembly.
2. Record the measurement against the published tolerance.
3. Provide supervised practice on guarding and measurement, then reassess the criteria.
Answer: Document both gaps, correct safety first, and reassess against the same standard.
Check: A working result does not cancel a safety criterion or make the tolerance optional.

Common misconceptions

- A completed product proves that the process was safe.
- Competency assessment is a single pass/fail observation with no feedback.
- Employer preference alone defines a national competency.
- Remediation means lowering the criterion.

Practice patterns

- Map a task to observable criteria.
- Choose safe practice and demonstration conditions.
- Interpret performance evidence and plan a fair reassessment.
