Assessment Evidence and Feedback

LET · professional-education · BoardPrep lesson v2

Official examination scope

The PRC Professional Teachers page lists the 2025 amendment to the LEPT Enhanced Table of Specifications; consult the current official TOS for examination boundaries. This lesson teaches general assessment principles with university teaching-center references. It is not a statement of current Philippine classroom-assessment policy, and it claims no item frequency or weight.

Learning objectives

- Classify assessment by how evidence is used during learning or at a defined reporting point.
- Distinguish score consistency from whether evidence supports the intended interpretation.
- Use criteria and learner work to plan a proportionate next step and check its effect.

1. Start with the purpose and use

Start with the decision the evidence must support. Assessment is formative when information is used while learning is underway to adjust instruction or learner action; a short or ungraded quiz is not formative by length alone. Summative assessment summarizes achievement at a defined point. The same task can serve either purpose depending on when it is given, what the result is compared with, and how the evidence is used.

2. Validity and reliability answer different questions

Validity concerns whether evidence supports the intended interpretation or decision for the stated purpose. Reliability concerns consistency across comparable occasions, raters, or conditions. A scoring process can be consistent yet measure the wrong target; an aligned task can still need clearer criteria or rater calibration. Ask separately: does the task represent the intended competency, and would comparable work receive consistent judgments under the stated criteria?

3. Turn evidence into a next step

Compare learner work with the intended competency and explicit criteria. Separate the answer from the reasoning or performance evidence, then look for a pattern across responses rather than treating one error as a fixed learner trait. Choose a limited response—such as clarifying one misconception, changing a representation, or giving criterion-linked feedback—and collect new evidence to see whether that response helped.

4. Triangulate when the competency is broad

A broad competency may require a product, an observed performance, and the learner’s explanation. Check that each source addresses the same intended target and note any disagreement. Multiple sources can reveal a gap that one score hides, but they do not automatically make a decision valid: the criteria, task conditions, accessibility, and interpretation still matter.

Use an exit ticket formatively

Question: An exit ticket shows that several learners selected the correct answer but used the same unsupported reason. What should the teacher do next?
1. Separate the selected answer from the reasoning evidence.
2. Name the shared misconception without treating one response as a permanent learner trait.
3. Plan a short explanation or comparison task, then check the reasoning with a new example.
Answer: Use the reasoning pattern to plan targeted instruction and a follow-up check.
Check: The evidence changes the next lesson and is checked again, so it is being used formatively.

Check rubric alignment

Question: A task asks learners to interpret evidence and justify a conclusion, but its rubric scores spelling only. What is the main concern?
1. State the intended construct: evidence interpretation and justification.
2. Compare the scored criteria with that construct.
3. Because spelling alone does not represent the intended reasoning, the score cannot support that intended interpretation.
Answer: The task has a validity alignment problem. Reliability of scoring is a separate question.
Check: A consistent spelling score would not repair the mismatch between the rubric and the target competency.

Separate validity from scoring consistency

Question: Two raters give similar scores, but the task is meant to assess evidence-based reasoning and its rubric scores spelling only. What should be addressed?
1. Name the intended competency: interpret evidence and justify a conclusion.
2. Compare that target with the rubric criteria and the work actually scored.
3. Treat consistent scoring as evidence about reliability, then revise or review the interpretation because the rubric misses the intended reasoning.
Answer: The scores may be consistent, but the rubric does not support the intended validity claim.
Check: Reliability and validity answer different questions; one does not guarantee the other.

Common misconceptions

- Calling every short quiz formative even when the results do not affect learning or
- instruction.
- Treating reliability and validity as interchangeable or assuming one guarantees the other.
- Changing the target competency when a learner instead needs an accessible way to show it.
- Making a lasting judgment about a learner from one response or one evidence source.

Practice patterns

- For formative-assessment items, identify how the evidence changes a next teaching or learning
- action.
- For validity and reliability items, name the target interpretation separately from score
- consistency.
- For performance tasks, compare criteria, learner work, and evidence sources before judging the
- competency.
