Assessment Evidence and Feedback

LET · professional-education · BoardPrep lesson v1

Official examination scope

The PRC Professional Teachers page lists the 2025 amendment to the LEPT Enhanced Table of Specifications. Consult the official TOS for current subject and competency boundaries. This lesson uses DepEd classroom-assessment guidance to teach assessment concepts; it does not claim a particular item frequency or weight.

Learning objectives

- Distinguish formative use of evidence during learning from summative reporting at a defined
- point.
- Separate validity of an interpretation from reliability or consistency of scores.
- Choose an instructional next step that responds to evidence and preserves the target
- competency.

1. Start with the purpose and use

Assessment is formative when evidence is used during learning to adjust teaching or learning. A quiz is not formative solely because it is short or ungraded; its purpose and use matter. Summative assessment summarizes achievement at a defined point. The same task can serve different purposes depending on how its evidence is interpreted and used.

2. Validity and reliability answer different questions

Validity asks whether evidence supports the intended interpretation or decision. Reliability concerns consistency across comparable occasions, raters, or conditions. A scoring process may be consistent while measuring the wrong target. Conversely, a well-aligned task can still need clearer criteria or rater calibration. Neither term is a substitute for the other.

3. Turn evidence into a next step

Compare learner work with the intended competency and explicit criteria. Look for a pattern in the reasoning, not only a right-or-wrong total. Select a short response such as reteaching one misconception, changing a representation, or giving criterion-linked feedback. Then collect new evidence to see whether the response helped.

4. Triangulate when the competency is broad

A complex competency may require more than one evidence source, such as a product, observed performance, and learner explanation. Check whether the sources address the same intended target. Multiple sources do not automatically make a decision valid, but they can reveal gaps that a single score hides.

Use an exit ticket formatively

Question: An exit ticket shows that several learners selected the correct answer but used the same unsupported reason. What should the teacher do next?
1. Separate the selected answer from the reasoning evidence.
2. Name the shared misconception without treating one response as a permanent learner trait.
3. Plan a short explanation or comparison task, then check the reasoning with a new example.
Answer: Use the reasoning pattern to plan targeted instruction and a follow-up check.
Check: The evidence changes the next lesson and is checked again, so it is being used formatively.

Check rubric alignment

Question: A task asks learners to interpret evidence and justify a conclusion, but its rubric scores spelling only. What is the main concern?

1. State the intended construct: evidence interpretation and justification.
2. Compare the scored criteria with that construct.
3. Because spelling alone does not represent the intended reasoning, the score cannot support that intended interpretation.
Answer: The task has a validity alignment problem. Reliability of scoring is a separate question.
Check: A consistent spelling score would not repair the mismatch between the rubric and the target competency.

Common misconceptions

- Calling every short quiz formative even when the results do not affect learning or
- instruction.
- Treating reliability and validity as interchangeable or assuming one guarantees the other.
- Changing the target competency when a learner instead needs an accessible way to show it.
- Making a lasting judgment about a learner from one response or one evidence source.

Practice patterns

- Identify assessment purpose from when and how the teacher uses results.
- Distinguish score consistency from evidence-to-construct alignment.
- Select a next teaching step from a stated pattern in learner evidence.
- Identify whether criteria and evidence represent the intended competency.
